

Application Fluid for Decals & Installation Methods

Use a clean spray bottle (approximately 8 oz)

Add 1 oz of isopropyl alcohol (cheap stuff)

Add 3 drops of dishwashing liquid (pure; no aloe, scents, etc)

Add water and mix thoroughly

Weather should be above 50 degrees. No direct sun (hot day) or windy conditions or forecast of rain

Clean mounting area decal is to be applied with Windex. If greasy use alcohol

Hold or tape decal in place with backing on to verify location. Stand back and make sure this is where you want it. Mark decal location with pencil and remove***

Peel all of rear backing off decal. Be careful not to let sticky sides touch each other

Spray back of decal and area to be applied with plenty of solution. Alcohol in solution will assist drying

Set decal in place. Decal will be able to be shifted to your desired position (pencil marks) however don't take too long as depending on weather conditions drying times will vary

Work air bubbles out from center to both ends. A rag or soft plastic squeegee helps.

Peel off front face backing at a right angle (don't want decal to shift)

Continue working air bubbles out from center to both ends.

***Alternate mounting; tape decal to mounting area in place with 1 1/2" masking tape right down the center. Do not peel all of rear backing from decal; work each half of decal as per instructions above below this line.
